

qClip Desktop — Install & First Clip

No Docker required · Windows & macOS (Apple Silicon) · Beta v1.0.0-beta.5

qClip runs on your computer as a normal desktop app. **Creators do not install Docker.** Get the installer from your invite kit (**installers/** folder), Drive link, or Lemon Squeezy — not from a public GitHub download URL (private repo returns 404).

Quick comparison

	Windows	macOS
Installer	qClip-Setup-win-x64.exe (~487 MB)	qClip-mac-arm64.dmg
First-run warning	SmartScreen → More info → Run anyway	Gatekeeper → right-click → Open
Logs folder	%LOCALAPPDATA%\qClip\logs\	~/Library/Application Support/qClip/logs/
Chip / OS	Windows 10/11 64-bit	Apple Silicon (M1+) · macOS 12+

What you need (both platforms)

- License key from your invite email (SCPRO-XXXX-XXXX-XXXX-XXXX)
- About 16 GB RAM minimum (32 GB recommended)
- Free disk space for models on first launch (multi-GB)
- A short public video URL for the first test (do not start with a long VOD)

Part 1 — Windows step-by-step

Before you start

- Windows 10 or 11 (64-bit)
- NVIDIA GPU recommended (CPU works but is slower)
- Installer: qClip-Setup-win-x64.exe from invite kit → installers\

Install and run

1. Open invite kit → **installers\qClip-Setup-win-x64.exe**.
2. Double-click the .exe in File Explorer.
3. If SmartScreen appears: **More info** → **Run anyway**. Normal for unsigned beta.
4. Finish the installer (defaults are fine).

5. Start menu → **qClip**. Wait for splash → main UI. First launch may download AI models.
6. Settings → Get started → **Ready**. If Needs attention, use Help → Troubleshooting first.
7. Settings → License → paste SCPRO-... key → Activate.
8. New job → short public URL → wait until **done** → play a clip.
9. Confirm logs: Win+R → **%LOCALAPPDATA%\qClip\logs** → sidecar.log and electron.log.

Windows pass checklist

- Installed without Docker
- SmartScreen handled (More info → Run anyway)
- Splash → main UI
- License activated
- Short job completed
- Clip plays in-app
- Logs folder present

Zip logs for support (Windows)

In PowerShell:

```
Compress-Archive -Path "$env:LOCALAPPDATA\qClip\logs" -DestinationPath  
"$env:USERPROFILE\Desktop\qclip-smoke-win-logs.zip" -Force
```

Part 2 — macOS step-by-step (Apple Silicon)

Before you start

- Mac with Apple Silicon (M1 / M2 / M3 / ...)
- macOS 12 or newer
- Installer: qClip-mac-arm64.dmg from invite kit → installers/ (or build first — see below)

Install and run

1. Open **installers/qClip-mac-arm64.dmg** from invite kit or Drive link.
2. Double-click the DMG in Finder.
3. Drag **qClip** into **Applications**.
4. If blocked: Applications → Control-click qClip → Open → Open (unsigned beta).
5. Launch qClip. Splash → main UI. First launch may download models.
6. Settings → Get started → Ready.
7. Settings → License → paste SCPRO-... → Activate.
8. New job → short URL → done → play a clip.
9. Logs: Finder → Go → Go to Folder... → ~/Library/Application Support/qClip/logs/

macOS pass checklist

- Installed without Docker
- Gatekeeper handled (right-click → Open)
- Splash → main UI
- License activated
- Short job completed
- Clip plays in-app
- Logs folder present

Zip logs for support (macOS)

In Terminal:

```
zip -r ~/Desktop/qclip-smoke-mac-logs.zip "$HOME/Library/Application Support/qClip/logs"
```

If the DMG is missing from the kit

On an Apple Silicon Mac (Node 20+, Python 3.11+, Xcode CLT, ~15 GB free):

```
cd /path/to/streamclip
```

```
./scripts/build_macos_solo.sh
```

```
# → apps/desktop/release/qClip-mac-arm64.dmg
```

```
./scripts/run_macos_solo_smoke.sh
```

```
# Copy DMG into invite kit installers/
```

Do not

- Do not install Docker Desktop just to try the creator beta
- Do not use anonymous GitHub release download links (they 404)
- Do not start with a long VOD for your first test

Help

- In-app: Help → Troubleshooting or Report a bug
- Reply to invite email with job ID + log zip if something fails

qClip Phase 0 beta · Desktop solo path · No Docker for creators
