

qClip

How it works — plain-English overview

qClip turns long streams and VODs into short, phone-ready clips. It finds the good moments, crops them for TikTok/Shorts/Reels, adds captions, and ranks what to post first — on your own computer.

In one line: Paste a link → wait → get ranked, captioned clips ready to post. No subscription. No watermark. You keep the files.

MIND MAP

qClip

What you get

- Short clips from long videos
- Vertical / square crops
- Animated captions
- Meme overlays + sound effects
- A ranked “post these first” list

How you use it

- Paste a Twitch / YouTube URL
- Or upload a video file
- Watch live progress
- Review clips in the library
- Approve / publish

Under the hood

- Website (Next.js)
- API (FastAPI)
- Job queue (Celery + Redis)
- Database (Postgres)
- File storage (MinIO)

AI helpers

- Whisper → speech to text
- YOLO → keep subject framed
- Llama → rank clip potential
- MiniLM → match memes to jokes
- ffmpeg → cut & export MP4

THE JOURNEY (7 STEPS)

- 1 You start a job**
Paste a URL or upload a file. The site doesn't freeze — it starts background work and shows a progress bar.
- 2 Ingest**
Download or save the source video once. Big files go into storage; the website never has to carry them.
- 3 Transcribe**
Whisper listens to the whole video one time and writes a transcript with word timing — the script for captions.
- 4 Find highlights**
Look for "wow" moments using loud audio, funny lines, motion, and chat spikes. Drop near-duplicates. Cut on word boundaries.
- 5 Rank clips**
A local language model compares candidates and scores which ones feel more worth posting.
- 6 Make each clip**
Track the person, crop for phones, stamp captions, optionally add memes/SFX, then export an MP4.
- 7 You review**
Browse the ranked shortlist, keep the winners, and publish when you're ready.

TECH STACK (SIMPLE)

WEBSITE

Next.js

Buttons, pages, live progress

SERVER API

FastAPI (Python)

Takes requests, starts jobs

WORK LINE

Celery + Redis

"Do this next" queue that can retry

MEMORY

PostgreSQL

Remembers jobs and clip metadata

VIDEO LOCKER

MinIO

Stores big media files

LOCAL CHAT AI

Ollama + llama3.2

Ranks clips without a paid API bill

AI MODELS & TOOLS

faster-whisper

Turns talking into timed text for captions and highlight clues.

YOLOv11 + ByteTrack

Finds the subject and keeps them centered while cropping.

llama3.2 (Ollama)

Compares clip ideas and ranks what should perform better.

MiniLM embedder

Matches a clip's joke/hook to the right meme asset.

librosa + ffmpeg

Times sound effects; cuts and encodes the final video (NVENC on NVIDIA GPUs for speed).

WHY IT'S DESIGNED THIS WAY

Background jobs

A long VOD can take minutes. That work can't live inside one button click.

GPU vs normal queue

Heavy vision/encode work doesn't wait behind slow chat or downloads.

One full transcript

Listen once, reuse everywhere — faster than re-listening per clip.

Self-hosted

Your machine, your files, no watermark, no metered cloud clip tax.
